

# ABC400 Series AC-DC Open Frame Power Supplies

## Key Features & Benefits

- High Efficiency up to 91% at 230 VAC
- Universal AC Input Voltage Range: 90-264 VAC
- Active Power Factor Correction
- Over temperature, output overvoltage, overcurrent and short circuit protection
- Low Conducted and Radiated EMI (EN 55022 cl A)
- Safety approved to the latest edition of the following standards: CSA/UL60950-1, EN60950-1 and IEC60950-1
- High Power Density Design: 16 W/in<sup>3</sup>
- Compact Size: 3.0 (W) x 1.5 (H) x 5.0 (L) inches
- RoHS Compliant
- CE Marked

ABC400 Series is a compact and efficient series of AC-DC open frame power supplies suited for telecom, datacom and many other applications.

The family meets the international information technology safety standards with the CE-Mark for the European Low Voltage Directive (LVD).

Their high efficiency allows a very minimal power loss in end equipment, resulting in higher reliability, ease of thermal management and regulatory approvals for an environmentally friendly end product.

## ORDERING INFORMATION

MODEL	INPUT VOLTAGE RANGE	OUTPUT VOLTAGE	NOM OUTPUT CURRENT	# OF OUTPUTS	OUTPUT POWER
ABC400-1012G	90 – 264 VAC	12 VDC	23 A	1	400 W
ABC400-1024G	90 – 264 VAC	24 VDC	13 A	1	400 W
ABC400-1048G	90 – 264 VAC	48 VDC	6.5 A	1	400 W

## OVERVIEW

The ABC400-10XXG is a high efficiency and high power density AC to DC power supply. It incorporates interleaved transition mode PFC converter and well proven two-FET forward converter, providing increased system reliability and high efficiency with around 1m/s system air cooling, ABC400-1012G can delivery up to 360W continuous output power and 408W for ABC400-1024G and ABC400-1048G.

$T_{hold}$	Hold-up Time	After last AC zero point, $V_o$ within regulation, $V_i = 115\text{ VAC}$ , $P_o nom$		16	ms

## INPUT FUSE

A slow-blow 8A input fuses (5 × 20 mm) in series with live line inside the power supply protects against severe defects. The fuse and a VDR form together with the input filter an effective protection against high input transients.

## INRUSH CURRENT

The AC-DC power supply exhibits an X-capacitance of only 1.47  $\mu\text{F}$ , resulting in a low and short peak current, when the supply is connected to the mains. The internal bulk capacitor will be charged through an power resistor which will limit the inrush current (see *Figure 2 and 3*).

Figure 2: Inrush current,  $V_{in} = 115\text{ Vac}$ ,  $90^\circ$  CH2:  $V_{in}$  (250V/div), CH3:  $I_{in}$  (10A/div)

<sup>1</sup> The power supply is provided with a minimum hysteresis of 8 V during turn-on and turn-off within the ranges.

# ABC400 Series

Figure 3: Inrush current,  $V_{in} = 230Vac$ ,  $90^\circ$  CH2:  $V_{in}$  (250V/div), CH3:  $I_{in}$  (10A/div)

## INPUT UNDER-VOLTAGE

If the sinusoidal input voltage stays below the input under voltage lockout threshold  $V_{on}$ , the supply will be inhibited. Once the input voltage returns within the normal operating range, the supply will return to normal operation again.

## POWER FACTOR CORRECTION

Power factor correction (PFC) is achieved by controlling the input current waveform synchronously with the input voltage. A specified PFC controller is implemented in the interleaved transition mode topology giving outstanding PFC results over a wide input voltage and load ranges. The input current will follow the shape of the input voltage.

## EFFICIENCY

The high efficiency (see Figure 4, 5 and 6) is achieved by using state-of-the-art silicon power devices in conjunction with interleaved transition mode PFC topology minimizing switching losses. Synchronous rectifiers on the output reduce the losses in the high current output path for ABC400-1012G schottky diode and ultra-fast diode are used as rectifiers for ABC400-1024G and ABC400-1048G due to the high output voltage level.

## OVERVOLTAGE PROTECTION

The AC-DC power supply provides a fixed threshold overvoltage (OV) protection implemented with a HW comparator. Once an OV condition has been triggered, the supply will shut down and latch the fault condition. The latch can be unlocked by disconnecting the supply from the AC mains only.

## CURRENT LIMITATION

The main output current limitation will decrease with linear derating to 50% at 70 °C if the ambient (inlet) temperature increases beyond 50 °C (see Figure 15).

## POWER GOOD SIGNAL

The Out-OK output gives a status indication of the converter and the output voltages. It can be used for control functions such as data protection, central system monitoring or as a part of a self-testing system. Connecting the Out-OK as shown in *Figure 16*,  $V_{OK} < 1.0\text{ V}$  indicates that the output voltage(s) of the converter are within the range.

Note: using the potentiometer, the monitor level tracks the programmed output voltage. In an error condition, if the output voltage is out of range due to overload or an external overvoltage,  $V_{OK}$  will approach  $V_p$ . The output is formed by an NPN transistor. The signal is isolated from the output.

Power Good Signal Description:

1. O/P V OK – Signal Low, Opto conducting, (max sink current 0.5 mA)
2. O/P V Bad – Signal High, Opto opening, (max leakage current 25  $\mu\text{A}$ )
