## Introduction

The ISL8115EVAL1Z is a Synchronous Buck Converter implementing Intersil's wide input range PWM controller ISL8115. Utilizing voltage mode control with input feed-forward, the ISL8115EVAL1Z maintains a constant loop gain for optimal transient response, especially for applications with a wide input voltage range. For a more detailed description of the ISL8115 functionality, refer to the [ISL8115 data sheet](#).

This application note includes the test setup, typical performance waveforms, schematic, layout and Bill of Materials (BOM).

FIGURE 2. ISL8115EVAL1Z TEST SET-UP

## Quick Test Setup

1. Ensure that the Evaluation board is correctly connected to the power supply and the electronic load prior to applying any power. Please refer to Figure 2 for proper set-up.
2. Set the input voltage to 12V, turn on the power supply and observe output voltage. The output voltage should variation should be within 5%.
3. Adjust load current within 30A. The output voltage variation should be within 5%.
4. Use oscilloscope to observe output ripple voltage and phase node ringing. For accurate measurement, please refer to Figure 3 for proper set-up.

Note: Test points TP1; TP3; TP8; TP9 are for voltage measurement only. Do not allow high current through these test points.

## Design Guide

The ISL8115EVAL1Z is optimized for 10V to 15V input voltage range. However, the evaluation board can be modified to support multiple applications due to the customer requirements. Please refer to the datasheet for the detailed information.

## Output Voltage Adjustment

The output voltage can be set by the resistor R4, R1. In order to keep the existing compensation parameters unchanged, adjust R4 to set the output voltage by the following Equation 1:

$$R4 = \frac{0.6V \times R1}{V_{out} - 0.6V} \quad (EQ. 1)$$

VMON monitors the output for UVP and OVP, the resistor divider value of R11/R8 should be the same with the R1/R4.

## Synchronization

ISL8115EVAL1Z board can be synchronized with an external clock. Apply a clock signal (10% to 90% duty cycle) in the range of 150kHz to 1.5MHz to the FSET pin makes the internal frequency synchronized with the external clock. Please remove R27 when the sync function is implemented.
