EZR32HG320 Data Sheet

EZR32HG320 Wireless MCU family with ARM Cortex-M0+ CPU, USB, and sub-GHz Radio

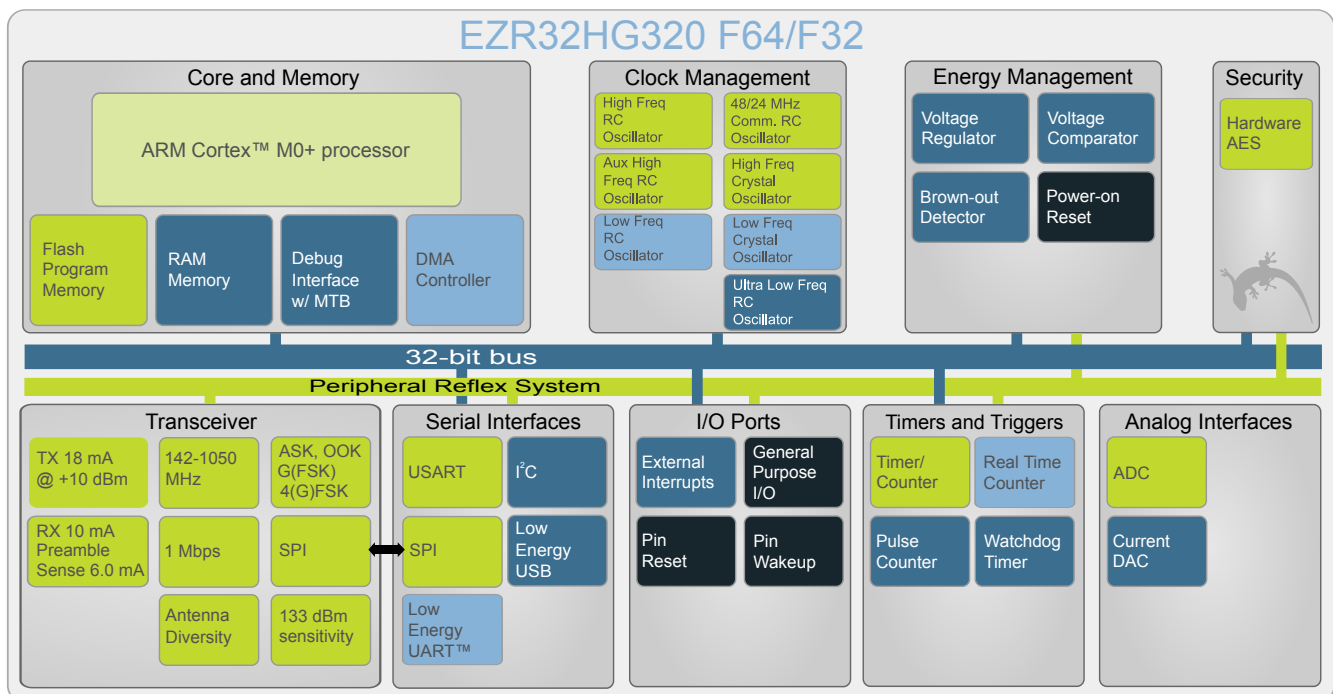

The EZR32HG Wireless MCUs are the latest in Silicon Labs family of wireless MCUs delivering a high performance, low-energy wireless solution integrated into a small form factor package. By combining a high performance sub-GHz RF transceiver with an energy efficient 32-bit MCU, the EZR32HG family provides designers the ultimate in flexibility with a family of pin-compatible devices that scale with 64/32 kB of flash and support Silicon Labs EZRadio or EZRadioPRO transceivers. The ultra-low power operating modes and fast wake-up times of the Silicon Labs energy friendly 32-bit MCUs, combined with the low transmit and receive power consumption of the sub-GHz radio, result in a solution optimized for battery powered applications.

32-Bit ARM Cortex wireless MCUs applications include the following:

- Energy, gas, water and smart metering
- Health and fitness applications
- Consumer electronics
- Alarm and security systems
- Building and home automation

KEY FEATURES

- Silicon Labs' energy efficient 32-bit Wireless MCUs
- Based on ARM Cortex M0 CPU core with 64 kB of flash and 8 kB RAM
- Best-in-class RF performance with EZradio and EZRadioPro transceivers
- Ultra-low power wireless MCU
 - Low transmit and receive currents
 - Ultra-low power standby and sleep modes
 - Fast wake-up time
- Rich set of peripherals including 12-bit ADC and IDAC, multiple communication interfaces (USB, UART, SPI, I2C), multiple GPIO and timers
- AES Accelerator with 128-bit keys

1. Feature List

The HG highlighted features are listed below.

MCU Features

- ARM Cortex-M0+ CPU platform
 - Up to 25 MHz
 - 64/32 kB Flash w/8 kB RAM
 - Hardware AES with 128-bit keys
- Flexible Energy Management System
 - 20 nA @ 3 V Shutoff Mode
 - 0.6 μ A @ 3 V Stop Mode
 - 127 μ A/MHz @ 3 V Run Mode
- Timers/Counters
 - 3 \times Timer/Counter
 - 3 \times 3 Compare/Capture/PWM channels
 - Real-Time Counter
 - 16/8-bit Pulse Counter
 - Watchdog Timer
- Communication interfaces
 - 1 \times USART (UART/SPI)
 - 1 \times Low Energy UART
 - 1 \times I2C Interface with SMBus support
 - Universal Serial Bus (USB)
- Ultra low power precision analog peripherals
 - 12-bit 1 Msamples/s ADC
 - On-chip temperature sensor
 - Current Digital to Analog Converter
- Up to 25 General Purpose I/O pins

RF Features

- Frequency Range
 - 142-1050 MHz
- Modulation
 - (G)FSK, 4(G)FSK, (G)MSK, OOK
- Receive sensitivity up to -133 dBm
- Up to +20 dBm max output power
- Low active power consumption
 - 10/13 mA RX
 - 18 mA TX at +10 dBm
 - 6 mA @ 1.2 kbps (Preamble Sense)
- Data rate = 100 bps to 1 Mbps
- Excellent selectivity performance
 - 69 dB adjacent channel
 - 79 dB blocking at 1 MHz
- Antenna diversity and T/R switch control
- Highly configurable packet handler
- TX and RX 64 byte FIFOs
- Automatic frequency control (AFC)
- Automatic gain control (AGC)
- IEEE 802.15.4g compliant

System Features

- Power-on Reset and Brown-Out Detector
- Debug Interface
- Temperature range -40 to 85 $^{\circ}$ C
- Single power supply 1.98 to 3.8 V
- QFN48 package

2. Ordering Information

3. System Overview

3.1 Introduction

The EZR32HG320 Wireless MCUs are the latest in the Silicon Labs family of wireless MCUs delivering a high-performance, low-energy wireless solution integrated into a small form factor package. By combining a high performance sub-GHz RF transceiver with an energy efficient 32-bit ARM Cortex-M0+, the EZR32HG family provides designers with the ultimate in flexibility with a family of pin-compatible parts that scale from 32 to 64 kB of flash and support Silicon Labs EZRadio or EZRadioPRO transceivers. The ultra-low power operating modes and fast wake-up times combined with the low transmit and receive power consumption of the sub-GHz radio result in a solution optimized for low power and battery powered applications. For a complete feature set and in-depth information on the modules, the reader is referred to the *EZR32HG Reference Manual*.

The EZR32HG320 block diagram is shown below.

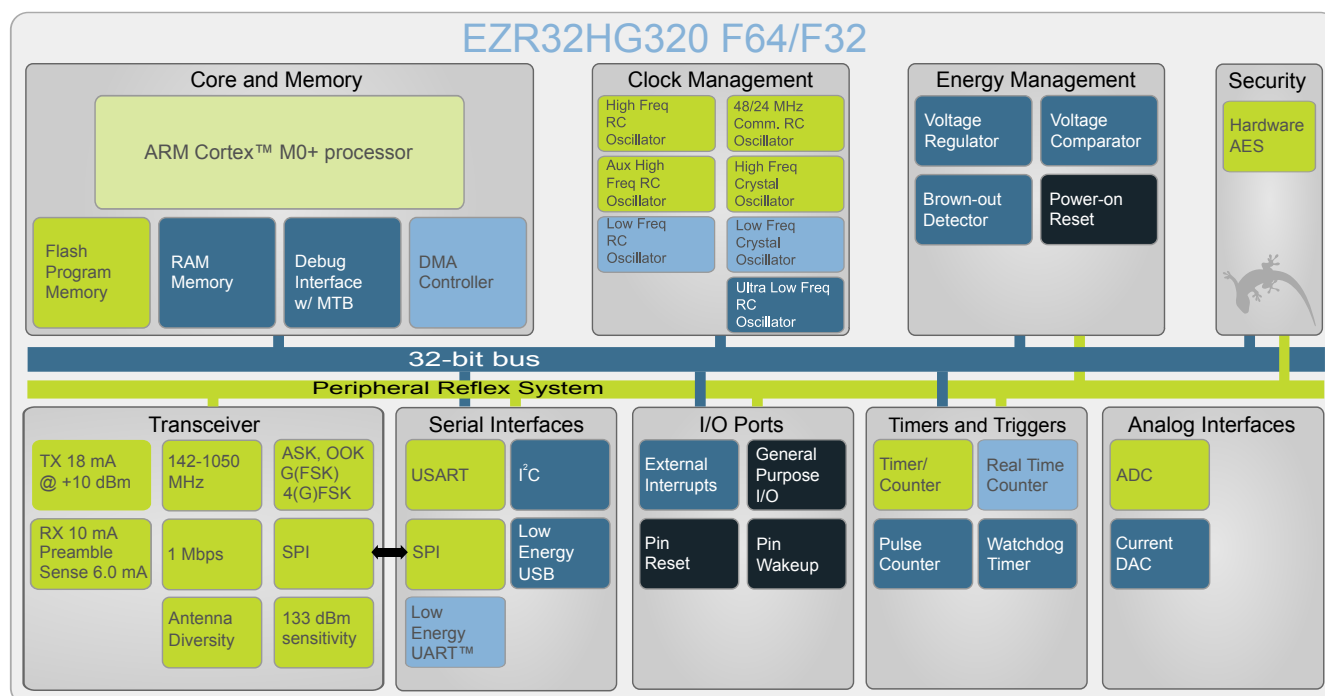

Figure 3.1. Block Diagram

3.1.1 ARM Cortex-M0+ Core

The ARM Cortex-M0+ includes a 32-bit RISC processor which can achieve as much as 0.9 Dhrystone MIPS/MHz. A Wake-up Interrupt Controller handling interrupts triggered while the CPU is asleep is included as well. The EZR32 implementation of the Cortex-M0+ is described in detail in *ARM Cortex-M0+ Devices Generic User Guide*.

3.1.2 Debugging Interface (DBG)

These devices include hardware debug support through a 2-pin serial-wire debug interface.

3.1.3 Memory System Controller (MSC)

The Memory System Controller (MSC) is the program memory unit of the EZR32HG microcontroller. The flash memory is readable and writable from both the Cortex-M0+ and DMA. The flash memory is divided into two blocks: the main block and the information block. Program code is normally written to the main block. Additionally, the information block is available for special user data and flash lock bits. There is also a read-only page in the information block containing system and device calibration data. Read and write operations are supported in the energy modes EM0 and EM1.

3.1.4 Direct Memory Access Controller (DMA)

The Direct Memory Access (DMA) controller performs memory operations independently of the CPU. This has the benefit of reducing the energy consumption and the workload of the CPU, and enables the system to stay in low energy modes when moving, for instance, data from the USART to RAM or from the External Bus Interface to a PWM-generating timer. The DMA controller uses the PL230 μ DMA controller licensed from ARM.

3.1.5 Reset Management Unit (RMU)

The Reset Management Unit (RMU) is responsible for handling the reset functionality of the EZR32HG.

3.1.6 Energy Management Unit (EMU)

The Energy Management Unit (EMU) manages all the low energy modes (EM) in EZR32HG microcontrollers. Each energy mode manages if the CPU and the various peripherals are available. The EMU can also be used to turn off the power to unused SRAM blocks.

3.1.7 Clock Management Unit (CMU)

The Clock Management Unit (CMU) is responsible for controlling the oscillators and clocks on-board the EZR32HG. The CMU provides the capability to turn on and off the clock on an individual basis to all peripheral modules in addition to enable/disable and configure the available oscillators. The high degree of flexibility enables software to minimize energy consumption in any specific application by not wasting power on peripherals and oscillators that are inactive.

3.1.8 Watchdog (WDOG)

The purpose of the watchdog timer is to generate a reset in case of a system failure, to increase application reliability. The failure may, for example, be caused by an external event, such as an ESD pulse, or by a software failure.

3.1.9 Peripheral Reflex System (PRS)

The Peripheral Reflex System (PRS) system is a network which lets the different peripheral module communicate directly with each other without involving the CPU. Peripheral modules which send out Reflex signals are called producers. The PRS routes these reflex signals to consumer peripherals which apply actions depending on the data received. The format for the Reflex signals is not given, but edge triggers and other functionality can be applied by the PRS.

3.1.10 Universal Serial Bus Controller (USB)

The USB is a full-speed USB 2.0 compliant device controller. The device supports both fullspeed (12 MBit/s) and low speed (1.5 MBit/s) operation. The USB also supports a Low Energy Mode that can be used to lower the current consumption up to 90% by shutting off the clock to the USB Core and possibly suspending the USHFRCO. The USB device includes an internal dedicated Descriptor-Based Scatter/Gather DMA and supports up to 3 OUT endpoints and 3 IN endpoints, in addition to endpoint 0.

3.1.11 Inter-Integrated Circuit Interface (I²C)

The I²C module provides an interface between the MCU and a serial I²C-bus. It is capable of acting as both a master and a slave, and supports multi-master buses. Both standard-mode, fast-mode and fast-mode plus speeds are supported, allowing transmission rates all the way from 10 kbit/s up to 1 Mbit/s. Slave arbitration and timeouts are also provided to allow implementation of an SMBus compliant system. The interface provided to software by the I²C module allows both fine-grained control of the transmission process and close to automatic transfers. Automatic recognition of slave addresses is provided in all energy modes.

3.1.12 Universal Synchronous/Asynchronous Receiver/Transmitter (USART)

The Universal Synchronous Asynchronous serial Receiver and Transmitter (USART) is a very flexible serial I/O module. It supports full duplex asynchronous UART communication as well as RS-485, SPI, MicroWire and 3-wire. It can also interface with ISO7816 Smart-Cards, IrDA and I2S devices.

3.1.13 Pre-Programmed USB/UART Bootloader

The bootloader presented in application note *AN0042* is pre-programmed in the device at the factory. The bootloader enables users to program the EZR32 through a UART or a USB CDC class virtual UART without the need for a debugger. The autobaud feature, interface, and commands are described further in the application note.

3.1.14 Low Energy Universal Asynchronous Receiver/Transmitter (LEUART)

The unique Low Energy Universal Asynchronous Receiver/Transmitter (LEUART™), the Low Energy UART, is a UART that allows two-way UART communication on a strict power budget. Only a 32.768 kHz clock is needed to allow UART communication up to 9600 baud/s. The LEUART includes all necessary hardware support to make asynchronous serial communication possible with minimum of software intervention and energy consumption.

3.1.15 Timer/Counter (TIMER)

The 16-bit general purpose Timer has 3 compare/capture channels for input capture and compare/Pulse-Width Modulation (PWM) output. TIMER0 also includes a Dead-Time Insertion module suitable for motor control applications.

3.1.16 Real Time Counter (RTC)

The Real Time Counter (RTC) contains a 24-bit counter and is clocked either by a 32.768 kHz crystal oscillator, or a 32.768 kHz RC oscillator. In addition to energy modes EM0 and EM1, the RTC is also available in EM2. This makes it ideal for keeping track of time since the RTC is enabled in EM2 where most of the device is powered down.

3.1.17 Pulse Counter (PCNT)

The Pulse Counter (PCNT) can be used for counting pulses on a single input or to decode quadrature encoded inputs. It runs off either the internal LFACLK or the PCNTn_S0IN pin as external clock source. The module may operate in energy mode EM0 - EM3.

3.1.18 Voltage Comparator (VCMP)

The Voltage Supply Comparator (VCMP) is used to monitor the supply voltage from software. An interrupt can be generated when the supply falls below or rises above a programmable threshold. Response time and thereby also the current consumption can be configured by altering the current supply to the comparator.

3.1.19 Analog to Digital Converter (ADC)

The Analog to Digital Converter (ADC) is a Successive Approximation Register (SAR) architecture, with a resolution of up to 12 bits at up to one million samples per second. The integrated input mux can select inputs from 4 external pins and 6 internal signals.

3.1.20 Current Digital to Analog Converter (IDAC)

The current digital to analog converter (IDAC) can source or sink a configurable constant current, which can be output on, or sinked from pin or ADC. The current is configurable with several ranges of various step sizes.

3.1.21 Advanced Encryption Standard Accelerator (AES)

The Advanced Encryption Standard Accelerator (AES) performs AES encryption and decryption with 128-bit keys. Encrypting or decrypting one 128-bit data block takes 52 HFCORECLK cycles with 128-bit keys. The AES module is an AHB slave which enables efficient access to the data and key registers. All write accesses to the AES module must be 32-bit operations (i.e., 8- or 16-bit operations are not supported).

3.1.22 General Purpose Input/Output (GPIO)

In the EZR32HG320, there are 25 General Purpose Input/Output (GPIO) pins, which are divided into ports with up to 16 pins each. These pins can individually be configured as either an output or input. More advanced configurations like open-drain, filtering and drive strength can also be configured individually for the pins. The GPIO pins can also be overridden by peripheral pin connections, like Timer PWM outputs or USART communication, which can be routed to several locations on the device. The GPIO supports up to 16 asynchronous external pin interrupts, which enables interrupts from any pin on the device. Also, the input value of a pin can be routed through the Peripheral Reflex System to other peripherals.

3.1.23 EZRadio® and EZRadioPro® Transceivers

The EZR32HG family of devices is built using high-performance, low-current EZRadio and EZRadioPro RF transceivers covering the sub-GHz frequency bands from 142 to 1050 MHz. These devices offer outstanding sensitivity of up to -133 dBm (using EZRadioPro) while achieving extremely low active and standby current consumption. The EZR32HG devices using the EZRadioPro transceiver offer frequency coverage in all major bands and include optimal phase noise, blocking, and selectivity performance for narrow band and licensed band applications, such as FCC Part 90 and 169 MHz wireless Mbus. The 69 dB adjacent channel selectivity with 12.5 kHz channel spacing ensures robust receive operation in harsh RF conditions, which is particularly important for narrow band operation. The active mode TX current consumption of 18 mA at +10 dBm and RX current of 10 mA coupled with extremely low standby current and fast wake times is optimized for extended battery life in the most demanding applications. The EZR32HG devices can achieve up to +27 dBm output power with built-in ramping control of a low-cost external FET. The devices can meet worldwide regulatory standards: FCC, ETSI, and ARIB. All devices using the EZRadioPRO transceiver are designed to be compliant with 802.15.4g and WMBus smart metering standards. The devices are highly flexible and can be programmed and configured via Simplicity Studio, available at www.silabs.com.

Communications between the radio and MCU are done over USART and IRQ, which requires the pins to be configured in the following way:

Table 3.1. Radio MCU Communication Configuration

EZR32HG MCU	RF	EZR32HG Function Assignment
PA2	SDN	GPIO Output
PC0	\bar{n} SEL	US1_CS #5
PC1	SDI	US1_MOSI #5
PC2	SDO	US1_MISO #5
PC3	SCLK	US1_CLK #5
PC4	\bar{n} IRQ	GPIO_EM4WU6 (GPIO Input with IRQ enabled)

3.1.23.1 EZRadio and EZRadioPRO Transceivers GPIO Configuration

The EZRadio and EZRadioPRO Transceivers have 4 General Purpose Digital I/O pins. These GPIOs may be configured to perform various radio-specific functions, including Clock Output, FIFO Status, POR, Wake-up Timer, TRSW, AntDiversity control, etc.

3.2 Configuration Summary

The features of the EZR32HG320 are a subset of the feature set described in the *EZR32HG Reference Manual*. The table below describes device specific implementation of the features.

4. Electrical Specifications

4.1 Test Conditions

4.1.1 Typical Values

The typical data are based on $T_{AMB} = 25^{\circ}\text{C}$ and $V_{DD} = 3.0\text{ V}$, as defined in [Table 4.3 General Operating Conditions on page 10](#), by simulation and/or technology characterisation unless otherwise specified.

4.1.2 Minimum and Maximum Values

The minimum and maximum values represent the worst conditions of ambient temperature, supply voltage and frequencies, as defined in [Table 4.3 General Operating Conditions on page 10](#), by simulation and/or technology characterisation unless otherwise specified.

4.2 Absolute Maximum Ratings

The absolute maximum ratings are stress ratings, and functional operation under such conditions are not guaranteed. Stress beyond the limits specified in the table below may affect the device reliability or cause permanent damage to the device. Functional operating conditions are given in [Table 4.3 General Operating Conditions on page 10](#).

Table 4.1. Absolute Maximum Ratings

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
Storage temperature range	T_{STG}		-55	—	150 ¹	$^{\circ}\text{C}$
Maximum soldering temperature	T_S	Latest IPC/JEDEC J-STD-020 Standard	—	—	260	$^{\circ}\text{C}$

Note:

- The TUNING field in the CMU_HFRCOCTRL register may be used to adjust the HFRCO frequency. There is enough adjustment range to ensure that the frequency bands above 7 MHz will always have some overlap across supply voltage and temperature. By using a stable frequency reference such as the LFXO or HFXO, a firmware calibration routine can vary the TUNING bits and the frequency band to maintain the HFRCO frequency at any arbitrary value between 7 MHz and 21 MHz across operating conditions.

Note:

1. On the average every ADC will have one missing code, most likely to appear around $2048 \pm n \cdot 512$ where n can be a value in the set $\{-3, -2, -1, 1, 2, 3\}$. There will be no missing code around 2048, and in spite of the missing code the ADC will be monotonic at all times so that a response to a slowly increasing input will always be a slowly increasing output. Around the one code that is missing, the neighbour codes will look wider in the DNL plot. The spectra will show spurs on the level of -78dBc for a full scale input for chips that have the missing code issue.

The integral non-linearity (INL) and differential non-linearity parameters are explained in Figure 3.14 (p. 33) and Figure 3.15 (p. 33), respectively.

4.16.3 EZRadioPRO (R6x) Receiver AC Electrical Characteristics

For PER tests, 48 preamble symbols, 4 byte sync word, 10 byte payload and CRC-32 was used.

Measured over 50000 bits using PN9 data sequence and data and clock on GPIOs. Sensitivity is expected to be better if reading data from packet handler FIFO especially at higher data rates.

1. BER sensitivity measure using GPIO3 for data and GPIO1 for data clock. Use of other GPIO pins could result in degraded sensitivity.
2. When in HFXO mode sensitivity will degrade at multiples of HFXO crystal frequency. Values in data sheet do not include spurious channel values.

4.16.4 EZRadioPRO (R6x) Transmitter AC Electrical Characteristics

The maximum data rate is dependent on the XTAL frequency and is calculated as per the formula: Maximum Symbol Rate = $F_{xtal}/60$, where F_{xtal} is the XTAL frequency (typically 30 MHz).

Default API setting for modulation deviation resolution is double the typical value specified.

Output power is dependent on matching components and board layout.

13	XOUT	EZRadio peripheral crystal oscillator output. Connect to an external 26/30 MHz crystal or leave floating if driving the XOUT pin with an external signal source.			
14	XIN	EZRadio peripheral crystal oscillator input. Connect to an external 26/30 MHz crystal or to an external clock source. If using an external clock source with no crystal, dc coupling with a nominal 0.8 VDC level is recommended with a minimum ac amplitude of 700 mVpp. Refer to AN417 for more details about using an external clock source.			
15	GPIO2	General Purpose Digital I/O for the radio. May be configured to perform various EZRadio functions, including Clock Output, FIFO Status, POR, Wake-up Timer, TRSW, AntDiversity control, etc.			
16	GPIO3	General Purpose Digital I/O for the radio. May be configured to perform various EZRadio functions, including Clock Output, FIFO Status, POR, Wake-up Timer, TRSW, AntDiversity control, etc.

5.3 Alternate Functionality Pinout

A wide selection of alternate functionality is available for multiplexing to various pins. This is shown in the table. The table shows the name of the alternate functionality in the first column, followed by columns showing the possible LOCATION bitfield settings.

Note: Some functionality, such as analog interfaces, do not have alternate settings or a LOCATION bitfield. In these cases, the pinout is shown in the column corresponding to the LOCATION 0.

Table 5.2. Alternate Functionality Overview

Alternate Functionality	LOCATION							Description
	0	1	2	3	4	5	6	
ADC0_CH0	PE12							Analog to digital converter ADC0, input channel number 0.
ADC0_CH1	PE13							Analog to digital converter ADC0, input channel number 1.
ADC0_CH4	PD4							Analog to digital converter ADC0, input channel number 4.
ADC0_CH5	PD5							Analog to digital converter ADC0, input channel number 5.
ADC0_CH6	PD6							Analog to digital converter ADC0, input channel number 6.
ADC0_CH7	PD7							Analog to digital converter ADC0, input channel number 7.
BOOT_RX	PD6							Bootloader RX.
BOOT_TX	PD7							Bootloader TX.
CMU_CLK0			PD7	PF2				Clock Management Unit, clock output number 0.
CMU_CLK1	PA1		PE12	PB11				Clock Management Unit, clock output number 1.
DBG_SWCLK	PF0							Debug-interface Serial Wire clock input. Note that this function is enabled to pin out of reset, and has a built-in pull down.
DBG_SWDIO	PF1							Debug-interface Serial Wire data input / output. Note that this function is enabled to pin out of reset, and has a built-in pull up.
GPIO_EM4WU 0	PA0							Pin can be used to wake the system up from EM4
GPIO_EM4WU 2	PC9							Pin can be used to wake the system up from EM4
GPIO_EM4WU 3	PF1							Pin can be used to wake the system up from EM4
GPIO_EM4WU 4	PF2							Pin can be used to wake the system up from EM4
GPIO_EM4WU 5	PE13							Pin can be used to wake the system up from EM4
HFX TAL_N	PB14							High Frequency Crystal negative pin. Also used as external optional clock input pin.
HFX TAL_P	PB13							High Frequency Crystal positive pin.

Alternate	LOCATION							Description
	0	1	2	3	4	5	6	
I2C0_SCL	PA1	PD7				PF1	PE13	I2C0 Serial Clock Line input / output.

Alternate Functionality	LOCATION							Description
	0	1	2	3	4	5	6	
US0_RX	PE11		PC10	PE12	PB8			USART0 Asynchronous Receive. USART0 Synchronous mode Master Input / Slave Output (MISO).
US0_TX	PE10			PE13	PB7			USART0 Asynchronous Transmit. Also used as receive input in half duplex communication. USART0 Synchronous mode Master Output / Slave Input (MOSI).
USB_DM	PC14							USB D- pin.
USB_DMPU	PA0							USB D- Pullup control.
USB_DP	PC15							USB D+ pin.
USB_VREGI	USB_VREGI							USB Input to internal 3.3 V regulator
USB_VREGO	USB_VREGO							USB Decoupling for internal 3.3 V USB regulator and regulator output
USRF1_RX			PD6					USARTRF1 Asynchronous Receive. USARTRF1 Synchronous mode Master Input / Slave Output (MISO).
USRF1_TX			PD7					USARTRF1 Asynchronous Transmit. Also used as receive input in half duplex communication. USARTRF1 Synchronous mode Master Output / Slave Input (MOSI).

5.4 GPIO Pinout Overview

The specific GPIO pins available in EZR32HG320 are shown in the GPIO pinout table. Each GPIO port is organized as 16-bit ports indicated by letters A through F, and the individual pin on this port is indicated by a number from 15 down to 0.

Note:

1. All dimensions shown are in millimeters (mm) unless otherwise noted.
2. Dimensioning and Tolerancing per ANSI Y14.5M-1994.
3. This drawing conforms to the JEDEC Solid State Outline MO-220, Variation VKKD-4.
4. Recommended card reflow profile is per the JEDEC/IPC J-STD-020 specification for Small Body Components.

	WW = Work Week	Corresponds to the year and work week of the mold date.
	TTTTTT = Mfg Code	Manufacturing Code from the Assembly Purchase Order from assembly PO.

8. Revision History

Revision 1.0

- Add R69 content

Revision 0.4

- Removed content currently documented the RFI database:
 - Environmental Table from the Electrical Specifications chapter
 - Moisture Sensitivity Level in the Soldering Information section

Revision 0.3

- Updated Current Consumption table
- Updated Power Management table
- Revised text describing LFXO Oscillator: “energyAware Designer” to “Configurator tool”
- Updated HFXO oscillator table, fHXFO parameter changed: “Supported nominal crystal Frequency” to “Supported frequency, any mode”.
- Updated LFRCO table
- Updated HFRCO table
- Updated AUXHFRCO table
- Updated USHFRCO table
- Updated ADC table
- Added USB electrical table
