1 Overview

TWR-S08MM128 is a low-cost evaluation, demonstration and development board that features an 8-bit MC9S08MM128 microcontroller. The TWR-S08MM128 can operate stand-alone or as the main control board in a Tower System with peripheral modules.

The following list summarizes the features of the MC9S08MM Tower MCU board:

- Tower compatible processor board
- Open Source BDM (OSBDM) circuit
- Analog measurement circuitry
- 4 LEDs
- DIP Switches and push buttons for user input
- Potentiometer
- MMA7361L three-axis accelerometer
- RS232 transceiver and 2x5 pin header

Figure 1. TWR-S08MM128 Block Diagram

2 Reference Documents

The documents listed below are available online. Refer to <http://www.freescale.com/tower> for the latest revision of all Tower System documentation.

- *TWR-S08MM128 Schematics*
- *TWR-S08MM128 Quick Start Guide*
- *TWR-S08MM128-KIT Lab Tutorial*
- *MC9S08MM128 Reference Manual*
- *MC9S08MM128 Data Sheet*
- *AN3561, USB Bootloader for the MC9S08JM60*

3 Hardware Features

This section provides more details about the features and functionality of the TWR-S08MM128.

3.1 Clocking

Two crystals are provided on the board for clocking the MC9S08MM128 device:

1. A 16 MHz crystal connected to XTAL2 and EXTAL2 for system clocking
2. A 32.768kHz crystal connected to XTAL1 and EXTAL1 for TOD usage

3.2 System Power

The TWR-S08MM128 can be powered by the Open Source BDM (OSBDM) circuit via the Mini-B USB connector when stand-alone. When assembled with the Tower System and the TWR-SER is configured to run USB device mode (J16 pin 3 and 4 connected), the Mini-B USB connector is no longer used as a power source and only used for OSBDM debugging purposes. In this case, the power will be supplied from the Mini-B USB from the TWR-SER. Please plug in the Mini-B USB connector from TWE-SER before plugging in the Mini-B USB connector from TWR-S08MM128.

A standard USB A male to Mini-B male cable (provided) can be used to supply power from a USB host or powered USB hub. Optionally, an AC to DC adapter with a USB A female receptacle (not provided) can be used as the power source.

A jumper, J11, can be used to isolate the 3.3V supply from the microcontroller. This connection can be used to measure the power usage of the MC9S08MM128 microcontroller.

3.3 Debug Interface

An on-board, MC9S08JM60 based OSBDM circuit provides a debug interface to the MC9S08MM128. A standard USB A male to Mini-B male cable (provided) can be used for debugging via the USB connector, J17. Refer to Section 6 for information on other modes of operation of the OSBDM.

3.4 RS232 Interface

An RS232 transceiver on the TWR-S08MM128 connects to a standard 2x5 pin header (refer to Figure 2). Selection jumpers J15 and J16 allow MC9S08MM128 SCI2 signals to be routed to either the RS232 transceiver or the OSBDM circuit. Refer to Figure 5 for more details.

Alternatively, when assembled as a Tower System, the MC9S08MM128 SCI1 TX and RX are routed to the SER-TWR. If the SER-TWR jumpers are configured to run in RS-232 mode, the SCI1 TX and the RX signal can be communicated via the RS232 connector from the TWR-SER. Please refer to the TWR-SER user manual (TWRSERUM) from www.freescale.com/tower for more detail.

MC9S08MM128 Signal	Pin		MC9S08MM128 Signal
Not Connected	1	2	Not Connected
TX2	3	4	Not Connected
RX2	5	6	Not Connected
Not Connected	7	8	Not Connected
GND	9	10	3.3V

Figure 2. RS232 2x5 Pin Header Connections

3.5 Infrared Port

The TWR-S08MM128 implements an infrared transmit and receive port. The transmit circuit is implemented with an infrared diode and the user can choose to drive the diode either with IRO or SCI TX. The receiver is implemented by an infrared transistor and the user can choose to input this signal to the SCI RX or the ACMP input. Jumpers J9, J25 and J26 are used for routing the connections, refer to Section 4 to set the jumpers. Please refer to application note AN4116, searchable from www.freescale.com

3.6 Medical Connector

The TWR-S08MM128 features a 2x10 expansion connector J27 (refer to Figure 3) to MED-EKG for routing the medical engine signals to external medical board so it can use the OPAMP, TRIAMP, ADC and DAC on MC9S08MM128 to implement the requirement signal conditioning for medical applications.

When the DSC MC56F8006 from the MED-EKG is enabled, MC9S08MM128 can choose to read the conditioned EKG results output from the DSC via I2C transmission (pin 3 and pin 4). To enable I2C communication, you must assemble the MEG-EKG with the Tower System because the TWR-SER has the pulled up resistors circuit required for I2C transmission.

In Figure 3, the **bold** text highlights the functions that are used to implement the MED-EKG demonstration. For detail about the MED-EKG, please refer to the MED-EKG user manual, MED-EKG lab

and schematic included in the TWR-S08MM128-KIT or TWR-MCF51MM-KIT. All of these are also available on Freescale.com/tower

TWR-S08MM128 Signal	Pin		TWR-S08MM128 Signal

Figure 3. Medical Connector 2x10 Pin Header Connections

3.7 Elevator Connections

The TWR-S08MM128 features two expansion card-edge connectors that interface to elevator boards in a Tower System: the Primary and Secondary Elevator connectors. The Primary Elevator connector, comprised of sides A and B, is utilized by the TWR-S08MM128, while the Secondary Elevator connector only makes connections to ground (GND). Figure 4 provides the pinout for the Primary Elevator connector. An “X” in the “Used” column indicates that there is a connection from the TWR-S08MM128 to that pin on the elevator connector. An “X” in the “Jmp” column indicates that a jumper is available that can configure or isolate the connection from the elevator connector.

3.8 Mechanical Form Factor

The TWR-S08MM128 is designed for the Freescale Tower System and complies with the electrical and mechanical specification as described in *Freescale Tower Electromechanical Specification*.

4 Jumper Table

There are several jumpers provided for isolation, configuration, and feature selection. Refer to the following table for details. The default installed jumper settings are shown in **bold**.

Figure 5. TWR-S08MM128 Jumper Table

Jumper	Option	Setting	Description of MC9S08MM128 signal routing
J1	DADP0 routing selection	1-2	Connect DADP0 to medical connector J27 pin 5
J2	DADM0 routing selection	1-2	Connect DADM0 to medical connector J27 pin 6
J3	VINP1 routing selection	1-2	VINP1 connect to GND
		2-3	VINP1 optionally connected to DACO
J4	Potentiometer connection	1-2	Connection of ADP4 to potentiometer
J5	DACO routing selection	1-2	Connect DACO to VINP1 if pin 2-3 of J3 is connected
		2-3	Connect DACO to a RC low pass filter
J6	DACO routing selection	1-2	Connect DACO to medical connector J27 pin 8
J7	TRIAMP routing selection	1-2	Connect TRIOUT1 to TRIOUT_SEL2
		2-3	Connect TRIOUT2 to TRIOUT_SEL2
J8	TRIAMP routing selection	1-2	Connect TRIOUT1 to TRIOUT_SEL1
		2-3	Connect TRIOUT2 to TRIOUT_SEL1
J9	Infrared receive routing	1-2	Connect Infrared transistor output to CMPP1
J10	USB3.3V connection	1-2	USB3.3V connects to external 3.3V power supply
		2-3	USB3.3V connects to on-chip USB 3.3V regulator output
J11	MCU IDD measure	1-2	For measuring MC9S08MM128 current
J12	OSBDM Bootloader mode or debugger mode selection	1-2	OSBDM IC in bootloader mode(For OSBDM firmware reprogramming)
		Open	OSBDM IC in debugger mode .
J13	BDM connector for MC9S08MM128	Open	BDM connector for MC9S08MM128
J14	BDM connector for JM60	Open	BDM connector for MC9S08JM60
J15	SCI2 TXD Routing Selection	1-2	Connect TX2 to the RS232 transceiver
		2-3	Connect TX2 to the OSBDM debugger interface circuit
J16	SCI2 RXD Routing Selection	1-2	Connect RX2 to the RS232 transceiver
		2-3	Connect RX2 to the OSBDM debugger interface circuit
J18	LED & Accelerometer connections	1-2	Connects LED4 to pin PTE7/TPM2CH3
		3-4	Connects LED3 to pin PTF0/TPM2CH2
		5-6	Connects LED2 to pin PTF1/RX2/TPM2CH1
		7-8	Connects LED1 to pin PTF2/TX2/TPM2CH0
		9-10	Connects ADP8 to ACCZ
		11-12	Connects ADP7 to ACCY
		13-14	Connects ADP6 to ACCX
J19	Accelerometer mode control	1-2	Connects PTA3 to SELF TEST pin of accelerometer
		3-4	Connects PTA6 to SLEEP pin of accelerometer
		5-6	Connects PTA5 to G-SELECT pin of accelerometer

J20	Accelerometer control	1-2	Connects PTB0 to 0G-DETECT pin of accelerometer
J21	RS232 connector	Open	2x5 RS232 connector
J24	Infrared filter connection	1-2	Choose whether to filter Infrared output
J25	Infrared transmit routing	1-2	Connects Infrared transistor output to ADP10
		3-4	Connects Infrared transistor output to RX1
		5-6	Connects either IRO or TX1 to Infrared diode base on J26
J26	Infrared transmit routing	1-2	TX1 pin drives Infrared transmit
		2-3	IRO pin drives Infrared transmit
J27	Medical board connector	Open	Connects to MED-EKG board

NOTE: For more detail, please refer to TWR-S08MM128 schematics available in the TWR-S08MM128-KIT or on Freescale.com/tower.

5 Input/Output Connectors and Pin Usage Table

The following tables provide details on which MC9S08MM128 pins are communicating with the TWR-MC9S08MM sensors, LEDs, switches and other I/O interfaces.

Figure 6. I/O Connectors and Pin Usage Table

TWR-S08MM128		MC9S08MM128			
I/O Component	I/O Label	Default	Alt 1	Alt 2	Alt 3
Dip Switch	SW3-1&4	PTA5	-	-	-
	SW3-2&3	PTB1	/BLMS	-	-
Push Button	SW1	PTD1	CMPP2	/RESET	-
	SW2	PTC6	KBI2P1	PRACMPO	ADP10
	SW4	PTE4	CMPP3	TPMCLK	IRQ
LED	LED1 (D9)	PTF2	TX2	TPM2CH0	-
	LED2(D10)	PTF1	RX2	TPM2CH1	-
	LED3(D11)	PTF0	TPM2CH2	-	-
	LED4(D12)	PTE7	TPM2CH3	-	-
Accelerometer MMA7361L	X_OUT	PTC2	KBI1P5	SPSCK2	ADP6
	Y_OUT	PTC3	KBI1P6	/SS2	ADP7
	Z_OUT	PTC4	KBI1P7	CMPP0	ADP8
Potentiometer	POT	PTA2	KBI1P1	RX1	ADP4
RS232 ICL3232	232_RXD	PTE6	RX2	-	-
	232_TXD	PTE5	TX2	-	-

NOTE: LED1 to LED4 are labelled as D9 to D12 on the TWR-S08MM128 silkscreen.

6 OSBDM

An on-board, MC9S08JM60 based OSBDM circuit provides a debug interface to the MC9S08MM128. The MC9S08JM60 is a USB-enabled microcontroller with an 8-bit HC9S08 core. The OSBDM circuit provides a USB-to-debug interface that allows run-control and debugging of the MC9S08MM128 target device. The USB drivers required to communicate with the OSBDM are provided in development tools such as Freescale CodeWarrior. When TWR-S08MM128 is used stand-alone, this single USB connection can also be used for power.

6.1 Bootloader Mode For MC9S08JM60

The MC9S08JM60 device used in the OSBDM circuit is preprogrammed with OSBDM debugger firmware and a USB Bootloader. The bootloader mode can be used to update the OSBDM debugger firmware if an update becomes available. Jumper J12 determines which application will run following a power-on reset. If the Bootloader Mode is chosen (jumper shunt on J12), the bootloader will be executed, allowing in-circuit reprogramming of the JM60 flash memory via USB. Refer to [Application Note AN3561](#) on the Freescale website (<http://www.freescale.com>) for details on the USB Bootloader.

The USB Bootloader communicates with a GUI application running on a host PC. The GUI application can be found on the [Freescale website](#); search keyword “JM60 GUI.” Refer to section 2.5 and 3.3 of AN3561 for details on installing and running the application.

Note:

The JM60 GUI Installer should be run before connecting the OSBDM in Bootloader Mode to a host USB port. Otherwise, the JM60 USB device will not be recognized and the proper drivers will not be loaded.

7 Bootloader Mode For MC9S08MM128

Unlike MC9S08JM60, MC9S08MM128 has an on-chip ROM based USB bootloader that allows the MC9S08MM128 for mass erase and programming via its USB interface. This on-chip bootloader does not consume user flash space. To enable USB bootloader mode for MC9S08MM128, on the TWR-S08MM128 module, set SW3 DIP switch 2 and 3 to position 3, as indicated in Figure 7. NOTE: Under normal development you will need to set SW3 DIP switch 2 and 3 to position 2.

Figure 7. Setting SW3 for MC9S08MM128 USB bootloader mode

8 BDM interface (Optional)

Both MC9S08MM128 and MC9S08JM60 have an on-chip background debug module. The user can choose to bypass the USB OSBDM interface and use the BDM interface for debugging and programming the corresponding chip instead. The BDM interface for MC9S08MM128 is at J13 header and MC9S08JM60 is at J14 from the TWR-S08MM128 module. The user needs a P&E USB BDM MULTILINK in order to use this interface. This is a repeat function of the OSBDM and is not required.
